

**Table of Contents**

Activity 1: Equivalence..... 1  
Activity 2: Inverse and Identity Properties ..... 5  
Activity 3: Add Like Things ..... 9  
Activity 4: Properties of Exponents..... 13  
Activity 5: Multiply Polynomial Expressions..... 21  
Activity 6: Divide Polynomial Expressions..... 25  
Activity 7: Factoring to Simplify Rational Expressions ..... 29  
Activity 8: Multiply and Divide Rational Expressions ..... 35  
Activity 9: Add and Subtract Rational Expressions ..... 41  
Activity 10: Complex Fractions..... 45  
Activity 11: Solve Rational Equations..... 49  
Activity 12: Expressions vs Equations ..... 59  
Activity 13: Introduction to Relations and Functions..... 63  
Activity 14: Function Notation ..... 67  
Activity 15: Ways to Represent Functions ..... 71  
Activity 16: Mathematical Modeling..... 77  
Activity 17: Reading the Stories of Graphs ..... 83  
Activity 18: Average Rate of Change ..... 93  
Activity 19: Slope and Intercepts of Lines ..... 97  
Activity 20: Linear Equations..... 101  
Activity 21: Systems of Two Equations ..... 107  
Activity 22: Systems of Three Equations with Three Variables ..... 111  
Activity 23: Linear Inequalities and Absolute Value ..... 117  
Activity 24: Simplify, Add, and Subtract Radical Expressions..... 125  
Activity 25: Multiply Radical Expressions..... 135  
Activity 26: Divide Radical Expressions & Rationalize Denominators ..... 139  
Activity 27: Rational Exponents..... 143  
Activity 28: Solve Radical Equations ..... 149  
Activity 29: Analyze Radical Expressions ..... 153  
Activity 30: Composition of Functions..... 157  
Activity 31: Inverse Functions..... 163  
Activity 32: Introduction to Exponential Functions ..... 171  
Activity 33: Exponential Growth and Decay..... 179  
Activity 34: Introduction to Logarithms..... 187  
Activity 35: Properties of the Graph of a Logarithmic Function..... 191  
Activity 36: Exponential and Logarithmic Graphs ..... 195  
Activity 37: Complex Numbers ..... 201  
Activity 38: Introduction to Quadratic Functions..... 204  
Activity 39: Graphing with Transformations..... 207  
Activity 40: Solve Quadratic Equations Graphically..... 212  
Activity 41: Zero Product Property..... 216  
Activity 42: Complete the Square..... 219  
Activity 43: Quadratic Formula ..... 223

From Activity 9 (adding and subtracting rational expressions)

**Skills Practice**

4. a. What is a factor? **a number that divides into another number exactly.**  
 b. What is a multiple? **a number that can be divided by another number without a remainder**  
 5. List the factors and multiples of 15.

Factors: **1, 3, 5, 15**

Multiples: **15, 30, 45, 60, 75, ...**

6. Find the Least Common Multiple of the following:

a. 3, 4, 6

b. 4, 8, 16

c. 3, 4, 8

d. 3, 5, 7

**12**

**16**

**24**

**105**

7. Find the LCD for the following sets of fractions.

a.  $\frac{1}{3} + \frac{3}{4} + \frac{5}{6}$

b.  $\frac{2}{3} + \frac{8}{9} + \frac{7}{12}$

c.  $\frac{1}{3} + \frac{1}{5} + \frac{1}{7}$

**12**

**36**

**105**

8. Using the LCDs found in the previous exercise, add one set of fractions.

a.  $\frac{23}{12}$     b.  $\frac{77}{36}$     c.  $\frac{71}{105}$

9. When can finding the least common multiple (LCM) be done by multiplying the numbers together? In which situations above would multiplying the numbers together give you a common multiple but NOT a least common multiple?

**When the numbers are all prime or if they don't share any common factors.**

**When one or more of the numbers share a common factor- if you multiply these together, you get a common multiple but not a LEAST common multiple.**

10. Find the Least Common Multiple of the following:

a.  $x, x + 2, x^2 + 2x$

b.  $(m + 3), (m - 3), m^2 - 9$

c.  $3y, (y + 3), y^2$

**$x^2 + 2x$**

**$m^2 - 9$**

**$3y^2(y + 3)$**

11. Find the LCD for the following sets of fractions.

a.  $\frac{1}{6x} + \frac{3}{3x^2} + \frac{5}{6}$

b.  $\frac{2}{x+2} + \frac{8}{x-2} + \frac{7}{x^2-4}$

c.  $\frac{1}{x-3} + \frac{1}{x+5} + \frac{1}{x-7}$

**$6x^2$**

**$x^2 - 4$**

**$(x - 3)(x + 5)(x - 7)$**

## Activity 13: Introduction to Relations and Functions

**This is a whole-class, teacher-led lesson. This lesson should be done on whiteboards if they are available.** Before this lesson, do the Real Number System activity in the appendix. To save time, have students start on it before class starts.

### Think. Pair. Share.

Individually, think of several statements that fit this pattern. Fill in the blanks. When prompted by your instructor, share your statements with your group, and choose a few statements to share with the whole class.

\_\_\_\_\_ **Mood** \_\_\_\_\_ **depends on** \_\_\_\_\_ amount of sleep \_\_\_\_\_

\_\_\_\_\_ **depends on** \_\_\_\_\_

Ask students to come up with several statements that follow this pattern. As they share their statements accept and write on the board all statements that the class agrees make a true statement. Complete consensus is not necessary. In the discussion, listen for or insert the word “relationship” to start students thinking toward the meaning of relation.

Class Discussion: After writing about 6 statements ask the class to identify, from the existing statements or ask students to provide additional statements, those that can be quantified. For example, “my mood during the day depends on whether or not I ate breakfast” (can be shortened on the board as “mood depends on breakfast”) is not easily quantifiable. However, “my mood on depends on how many hours of sleep I got” could be quantified, if mood is measured on a numeric scale. Other statements will be more obviously quantifiable.

After exploring a few quantifiable statements, point out the use of the word “relationship” in your discussions and explain that in mathematics these relationships are called a “Relation.”

In mathematics, these types of statements are called a \_\_\_\_\_

## Sample pages from Almy Education Transitional STEM materials (Van Wagoner and Jones)

As a group, choose 1 or 2 “depends on” statements that can be described numerically, and make a list of numbers that represent the relationship. For example,

<u>My mood*</u>	<b>depends on</b>	<u>hours of sleep</u>
1		0
4		3
7		6
10		12

\*as measured on a numeric scale

\_\_\_\_\_ **depends on** \_\_\_\_\_

\_\_\_\_\_ **depends on** \_\_\_\_\_

Class Discussion: As students share their examples, guide the discussion toward the use of the words “input” and “output.” Students will be inclined to associate input with the first blank, and output with the last blank, so make sure the process of the input/output relationship is clear.

Write on the board (and they should add to their notes) “A relation pairs an input with an output.”

Sample pages from Almy Education Transitional STEM materials (Van Wagoner and Jones)

A \_\_\_\_\_ pairs an \_\_\_\_\_ with an \_\_\_\_\_.

Look for student examples that can and cannot be classified as functions. Ask students to put those examples on the board for the class to compare. If one type of relation is lacking, help students modify their responses in order to produce a function and a non-function. Through the discussion help students discover the pattern that occurs in a function. Have them check their own tables of numbers for the function pattern. Do not name the pattern until students show an understanding of the concept of function. Once this understanding is evident, tell student this pattern has a name – “function.” Write on the board. “A function is a relation (a pairing) in which every input value has exactly one corresponding output value.” (or a similar definition)

A \_\_\_\_\_ is a \_\_\_\_\_ in which every \_\_\_\_\_ value has exactly \_\_\_\_\_ corresponding \_\_\_\_\_ value.

Ask a student to explain how they understand the difference between a relation and a function. Continue asking until explanations are clear and correct.

Tell students: From now on we will be concerned with understanding and working with functions. Reinforce understanding by writing these statements on the board.

output depends on input

output is a function of input

\_\_\_\_\_ depends on \_\_\_\_\_

\_\_\_\_\_ is a function of \_\_\_\_\_

Identify the input and output for each statement, then determine if the following statements are functions. Justify your decision. The following solutions may not apply depending on student justifications. Allow/encourage students to debate with each other and justify their ideas. If they conclude something is a function without much debate, you can ask what change could be made so it is not a function.

1. The cost of tuition is a function of the number of credit hours on a student’s schedule.  
Yes. 12 credits will only have one tuition cost on a standard tuition table.
2. The position of the sun in the sky depends on the time of day.  
Yes. The sun is in only one position at any given time.
3. The height of a child depends on age.  
No. There are multiple heights of children for each age.
4. The number of followers on your Instagram account each day.  
Yes, if you only check once a day. No, if the number fluctuates through the day and varies.
